                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  available on the World Wide Web.

(URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers.

Gene prediction was based on a Hidden Markov Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position G + C.

CAUTION: In some cases we may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg., gtg., or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Submitted (11-JUN-1998) Submitted on behalf of the Mycobacterium tuberculosis sequencing and mapping teams, Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 1SA Unite de Genetique Moleculaire Bacterienne, Institut Pasteur, 28 rue du Docteur Roux, 75724 Paris Cedex 15, France E-mail: parkhill@sanger.ac.uk On Jun 27, 1998 this sequence version replaced gi:2143285.

fragments is 1 of 24 rpob gene fragments (AAS05201-AAS0524) from
various Mycobacterial species. These rpoB gene fragments can be used
in the diagnosis and identification of Mycobacterium species using a
novel pekr-restriction fragment length polymorphism analysis (PRA)
method. The method comprises obtaining a restriction fragment length
convel pekr-restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments. Isolating,
amplitying and digesting the DNA fragment from the microorganism to
concern that the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for
diagnosis or to obtain epidemiological and pathogenesis information for
selection of appropriate theraphes, including M. tuberculosis, M. leprae
and non-tuberculous mycobacteria (NTM) encountered in subjects infected
with human immunodeficiency virus (HIV). Analysis of the rpoB gene
fragments is rapid, precise, simple and cost effective (only 1 PCR
required), and can differentiate between many species in a single
experiment, including those difficult to distinguish by usual biochemical
control of an order of the probes (AAS05227-AAS05242) for
                                                                                                                                                                                                                                                                                                                                                                ò

The present sequence for Mycobacterium scrofulaceum rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from fragment is 1 of 24 rpoB gene fragments can be used various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel pCR-restriction fragment length polymorphism analysis (PRA) novel PCR-restriction fragment length are polymorphism analysis (PRA) method comprises obtaining a restriction fragment length polymorphism analysis (PRA) amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments fragment to appropriate theraples including M. tuberculosis, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate theraples, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HTV). Analysis of the rpoB gene required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical defection of described are oligonucleotide probes (AAS05227-AAS05242) for detecting aspecies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HIV; PRA; RFLP;

The present sequence for Mycobacterium avium rpoB gene
fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from
fragment is 1 of 24 rpoB gene fragments can be used
various Mycobacterial species. These rpoB gene fragments can be used
on the diagnosis and identification of Mycobacterium species using a
novel PCR-restriction fragment length polymorphism analysis (PRA)
method comparises obtaining a restriction fragment length
polymorphism (RPLP) pattern of the 24 rpoB gene fragments; 1solating,
amplifying and digesting the DNA fragment from the microorganism to
be identified and comparing the RPLP patterns from the known rpoB gene
fragments with the unidentified fragment. The rpoB gene fragments
are useful to identify a wide range of Mycobacterium species, e.g. for
diagnosis or to obtain epidemiological and pathogenesis information for
selection of appropriate therapies, including M. tuberculosis, M. leprac
and non-tuberculous mycobacteria (NTM) encountered in subjects infected
with human immunodeficiency virus (HTW). Analysis of the rpoB gene
fragments is rapid, precise, simple and cost effective (only 1 PCR
fragments in including those difficult to distinguish by usual biochemical
experiment, including those difficult to distinguish by usual biochemical
cests. Also described are oligonoucleotide probes (AASO5227-AASO5242) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 121 CCATCGAGTACCTGGTTCGCCTGCACCACGCCTCTCAGGGTGGCCAGGCCCCCGTTATGA 180

BP.

AAS05201 standard; DNA; 208

```
The present sequence for Mycobacterium celatum rpoB gene
Iragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from
various Mycobacterial species. These rpoB gene fragments can be used
in the diagnosis and identification of Mycobacterium species using a
novel PCR-restriction fragment length polymorphism analysis (PRA)

method. The method comprises obtaining a restriction fragment length
polymorphism (RFLP) pattern of the 24 rpoB gene fragment length
polymorphism (RFLP) pattern of the 24 rpoB gene fragment Log
polymorphism (RFLP) pattern of the 24 rpoB gene fragment Log
be identified and comparing the RFLP patterns from the Mnown rpoB gene
fragments with the unidentified fragment. The rpoB gene fragments
fragments with the unidentified fragment. The rpoB gene fragments
are useful to identify a wider range of Mycobacterium species, e.g. for
diagnosis or to obtain epidemiological and pathogenesis information for
selection of appropriate therapies, including M. tuberculosis, M. leprae
and non-tuberculous mycobacteria (NTM) encountered in subjects infected
with human immunodeficiency virus (HIV). Analysis of the rpoB gene
fragments is rapid, precise, simple and cost effective (only 1 PCR
required), and can differentiate between many species in a single
tragment, including those difficult to distinguish by usual biochemical
cests. Also described are oligonucleotide probes (AASO5227-AASO5242) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1;

The present sequence for Mycobacterium gordonae type I rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a convel PCR-restriction fragment length polymorphism malysis (PRA) and polymorphism (RFLP) pattern of the 24 rpoB gene fragments isolating, applymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, and identified and comparing the RFLP patterns from the Mrown rpoB gene fragments with the unidentified fragment. The rpoB gene fragments is information for can exeful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical experiment, including those difficult to distinguish by usual biochemical and cost fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GCCTGAACACCGATCATCCGATCACCACCACGACGCTGACCGAAGAGACGTCGTCGCCA 120

These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including My tuberculous mycobacteria (MTM) encountered in subjects infected and non-tuberculous mycobacteria (MTM) encountered in subjects infected with human immunodeficiency virus (MTW) encountered in subjects infected fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical exercise. Also described are oligionucleotide probes (AASO5227-AASO5227) for

The present sequence for Mycobacterium xenopi rpoB gene
fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from
craines Mycobacterial species. These rpoB gene fragments can be used
in the diagnosis and identification of Mycobacterium species using a
cnovel PCR-restriction fragment length polymorphism ranalysis (PRA)
method. The method comprises obtaining a restriction fragment length
cc polymorphism (FRLP) pattern of the 24 rpoB gene fragments; isolating,
amplifying and digesting the DRA fragment from the microorganism to
be identified and comparing the RFLP patterns from the known rpoB gene
cc amplifying and digesting the PRA FRLP patterns from the known rpoB gene
cc and infinity a wide range of Mycobacterium species, e.g. for
diagnosis or to obtain epidemiological and pathogenesis information for
selection of appropriate therapies, including M. tuberculosis, M. leprae
cc and non-tuberculous mycobacteria (NTM) encountered in subjects infected
with human immunodeficiency virus (NTM) encountered in subjects infected
cwith human immunodeficiency virus (NTM) analysis of the rpoB gene
fragments is rapid, precise, simple and cost effective (only 1 PCR
crequired), and can differentiate between many species in a single
credited, and can differentiate between many species in a single
experiment, including those difficult to distinguish by usual blochemical
cesperiment, including those difficult to distinguish by usual blochemical
cesperiment, and considered are oligonucleotide probes (AASO5227-AASO5242) for
detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1;

and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AASO5277-AASO5242) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence for Mycobacterium gordonae type III rpoB gene fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO524) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method. The method comprises obtaining a restriction fragment length polymorphism analysis (PRA) polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Non-tuberculous mycobacteria; rpoB gene fragment; NTM; HIV; PRA; RFLP; PCR-restriction fragment length polymorphism analysis; ds.

The present sequence for Mycobacterium marinum rpoB gene fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenes1s information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR

required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence for Mycobacterium gordonae type II rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS0524) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments in length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments

:
diagnosis or to obtain epidemiological and pathogenesis information for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including W. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only I PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical tests. Also described are oligonuclectide probes (AASO5227-AASO5242) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HIV; PRA; RFLP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GTCTGAACGTCGGCAAGCCGATCACCACGCTCACCACGAGGAAGACGTCGTAGCCA 120

method. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpob gene fragments; length polymorphism (RFLP) pattern of the 24 rpob gene fragments; lasolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpob gene fragments with the unidentified fragment. The rpob gene fragments fragments with the unidentified fragment. The rpob gene fragments fragments with the unidentified fragment. The rpob gene fragments fragments of the obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprac selection of appropriate therapies, including M. tuberculosis, M. leprac with human immunodeficiency virus (HIV). Analysis of the rpob gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleoclide probes (AASO5227-AASO5242) for certain specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HIV; PRA; RFLP;

The present sequence for Mycobacterium gordonae type IV rpob gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from toward Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel pCR-restriction fragment length polymorphism analysis (PRA) and polymorphism (RPLP) pattern of the 24 rpoB gene fragment length polymorphism (RPLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RPLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments fragments with the unidentified range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (Only 1 pCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical cests. Also described are oligonucleotide probes (AAS05227-AAS05242) for cests.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ä

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Traquent is 1 of 4 roops gene fragments (ASASO$201-ASSO$224) from covarious Mycobacterial species. These roob gene fragments can be used a various Mycobacterial species. These roob gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) comprises obtaining a restriction fragment length polymorphism (RELP) pattern of the 24 rpob gene fragment; isolating, amplitying and digesting the DNA fragment from the microorganism to be identified and comparing the RELP patterns from the known rpob gene fragments with the unidentified fragment. The rpob gene fragments comparing the RELP patterns from the roops gene fragments of a grace useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M tuberculosis, M leprae cand non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (NTM) encountered in subjects infected with human immunodeficiency virus (NTM) encountered in subject infected required), and can differentiate between many species in a single required), and can differentiate between many species in a single creating specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HIV; PRA; RFLP;

The present sequence for Mycobacterium terrae rpoB gene fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) anoyel PCR-restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate theraptes, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HTV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical contents. Also described are oligonuclectide probes (AASO5227-AASO5242) for easts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 121 CCATCGAGTACCTGGTTCGCCTGCACCACGCCTCTCAGGGTGGCCAGGCCCCCGTTATGA 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1, Ap

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence for Mycobacterium celatum rpoB gene fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from fragment is 1 of 24 rpoB gene fragments (CASO5201-AASO5224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are seful to identify a wide range of Mycobacterium species, e.g. for selection of appropriate therapies, including M. tuberculosis, M. leprace and non-tuberculous mycobacteria (NTW) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 pCR required), and can differentiate between many species in a single captering those difficult to distinguish by usual biochemical ests. Also described are oligonucleotide probes (AASO5227-AASO5242) for detecting specific Mycobacterial species.
                                                     New DNA fragments from the rpoB gene of mycobacteria, useful for diagnosis and identification of many mycobacterial species by restriction fragment length polymorphism -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                             fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from
fragment is 1 of 24 rpoB gene fragments can be used
various Mycobacterial species. These rpoB gene fragments can be used
to the diagnosis and identification of Mycobacterium species using a
novel PCR-restriction fragment length polymorphism analysis (PRA)
method comprises obtaining a restriction fragment length
polymorphism (RFLP) pattern of the 24 rpoB gene fragment length
camplifying and digesting the DNA fragment from the microorganism to
be identified and comparing the RFLP patterns from the Known rpoB gene
fragments with the unidentified fragment. The rpoB gene fragments
are useful to identify a wide range of Mycobacterium species, e.g. for
diagnosis or to obtain epidemiological and pathogenesis information for
selection of appropriate therapies, including M. tuberculosis, M. leprae
and non-tuberculous mycobacteria (MTM) encountered in subjects infected
with human immunodeficiency virus (HTV). Analysis of the rpoB gene
fragments is rapid, precise, simple and cost effective (only 1 PCR
required), and can differentiate between many species in a single
experiment, including those difficult to distinguish by usual biochemical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Non-tuberculous mycobacteria; rpoB gene fragment; NTM; HIV; PRA; RFLP; PCR-restriction fragment length polymorphism analysis; ds.

fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from
fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from
various Mycobacterial species. These rpoB gene fragments can be used
to the diagnosis and identification of Mycobacterium species using a
novel PCR-restriction fragment length polymorphism manlysis (PRA)
method. The method comprises obtaining a restriction fragment length
method. The method comprises obtaining a restriction fragment length
caplifying and digesting the DNA fragment from the microorganism to
be identified and comparing the RFLP patterns from the Known rpoB gene
fragments with the unidentified fragment. The rpoB gene fragments
are useful to identify a wide range of Mycobacterium species, e.g. for
diagnosis or to obtain epidemiological and pathogenesis information for
selection of appropriate theraphes, including W. tuberculosis, M. leprae
and non-tuberculous mycobacteria (MTM) encountered in subjects infected
with human immunodeficiency virus (HTV). Analysis of the rpoB gene
fragments is rapid, precise, simple and cost effective (only 1 PCR
cequired), and can differentiate between many species in a single
experiment, including those difficult to distinguish by usual blochemical
distinctions and described are oligonucleotide probes (AAS05227-AAS05242) for
                                                                                                                                                                                                                                                                                                                   New DNA fragments from the rpoB gene of mycobacteria, useful for diagnosis and identification of many mycobacterial species by restriction fragment length polymorphism
                                                                                                                                                                                                                                   Park HJ;

Mycobacterium gordonae type III.

```
The present sequence for Mycobacterium gordonae type III rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used to the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragment length, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprace and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and Can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 GCCTGCACGTCGGCGATCCGATCACCAGCTCCACGCTGACCGAAGAAGAAGACGTCGTCGCCA 120

inc present suguence ou mycobacterium indivining Typob gene

rangement is 1 of 24 rpob gene fragments (AASO5224) from

various Mycobacterial species. These rpob gene fragments can be used
in the diagnosis and identification of Mycobacterium species using a
convel PCR-restriction fragment length polymorphism analysis (PRA)
method. The method comprises obtaining a restriction fragment length
polymorphism (RELP) pattern of the 24 rpob gene fragment is isolating,
amplifying and digesting the DNA fragment from the microorganism to
comparing the DNA fragment. The microorganism to
be identified and comparing the RELP patterns from the known rpob gene
fragments with the unidentified fragment. The rpob gene fragments
care useful to identify a wide range of Mycobacterium species, e.g. for
diagnosis or to obtain epidemiological and pathogenesis information for
selection of appropriate therapies, including M. tuberculosis, M. leprae
and non-tuberculous mycobacteria (MTW). Analysis of the rpob gene
fragments is rapid, precise, simple and cost effective (only 1 PCR
required), and can differentiate between many species in a single
captiment, including those difficult to distinguish by usual biochemical
cests. Also described are oligonucleotide probes (AASO5227-AASO5242) for
detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .;

The present sequence for Mycobacterium gordonae type I rpoB gene fragment is 1 of 24 rpoB gene fragments can be used various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragment is isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical tests. Also described are oligonuclectide probes (AASOS227-AASOS242) for detecting specific Mycobacterial species.
                                                                                                                                                  HIV; PRA; RFLP;

The present sequence for Mycobacterium tuberculosis rpoB gene fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5214) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) a novel PCR-restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragment; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments is rapid to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprace and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for detecting specific Mycobacterial species.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from
fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from
various Mycobacterial species. These rpoB gene fragments can be used
in the diagnosis and identification of Mycobacterium species using a
novel PCR-restriction fragment length polymorphism analysis (PRA)
method The method comprises obtaining a restriction fragment length
polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating,
amplifying and digesting the DNA fragment from the microorganism to
be identified and comparing the RFLP patterns from the Known rpoB gene
fragments with the unidentified fragment. The rpoB gene fragments
are useful to identify a wide range of Mycobacterium species, e.g. for
diagnosis or to obtain epidemiological and pathogenesis information for
selection of appropriate theraphes, including M. tuberculosis, M. laprae
and non-tuberculous mycobacteria (MTW) analysis of the rpoB gene
fragments is rapid, precise, simple and cost effective (only 1 PCR
required), and can differentiate between many species in a single
experiment, including those difficult to distinguish by usual blochemical
tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from
various Mycobacterial species. These rpoB gene fragments can be used
in the diagnosis and identification of Mycobacterium species using a
novel PCR-restriction fragment length polymorphism analysis (PRA)
method. The method comprises obtaining a restriction fragment length
complifying and digesting the DNA fragment from the microorganism to
be identified and comparing the RFLP patterns from the known rpoB gene
fragments with the unidentified fragment. The rpoB gene fragments
are useful to identify a wide range of Mycobacterium species, e.g. for
diagnosis or to obtain epidemiological and pathogenesis information for
selection of appropriate theraphes, including M. tuberculosis, M. leprae
and non-tuberculous mycobacteria (NTM) encountered in subjects infected
with human immunodeficiency virus (HIV). Analysis of the rpoB gene
fragments is rapid, precises, simple and cost effective (only 1 PCR
required), and can differentiate between many species in a single
experiment, including those difficult to distinguish by usual blochemical
control of a parcoprise of procies
control of a parcoprise of procies
control of the procies of the process (AAS05242) for

The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 robs gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate theraples, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency vitus (HTM). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HIV; PRA; RFLP;

required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence for Mycobacterium bovis rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism malysis (PRA) method. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments

ö
are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain repidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HTV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 GCCTGAACACCAATCATCCGATCACCACGACGACGCTGACGGAAGAGAGACGTCGTCGCCA 120

This oligonucleotide DNA primer is specific for Mycobacterium tuberculosis, and may be used to amplify a sample DNA by targeting a portion of the gene encoding rpoB. The 1st several bases comprise a nonhybridizing tail consisting of filler bases followed by a restriction site incorporated to facilitate cloning using the amplicon at a later date, if desired. The remaining bases hybridize to bacterial rpoB DNA. The method provides for the detection of M. tuberculosis and the concurrent determination of its drug susceptibility, particularly to rifamycin. The method can provide often greater than 95% sensitivity and 100% specificity. The biological sample is a fluid or tissue sample from a human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detection of Mycobacterium tuberculosis - by amplifying sample DNA with a primer set that targets portions of the gene encoding rpoB.

Polynucleotide sequences AAH51947 - AAH52092 represent DNA encoding proteins AAG81096 - AAG81241 Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying nucleotide or polypeptide sequence for use as drug target, involves providing algorithm that analyzes a functional relationship between nucleotide or polypeptide sequences, and comparing the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for generating a repertory of nucleic acids of tuf, fus, atpD and/or recA genes from which probes and/or primers are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical species with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more related microorganisms e.g. algae, archaea, bacteria, fungi and parasites, for universal detection and for specific and ubiquitous detection and identification of an algal, archaeal, bacterial, fungal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      primers which can be used to identify and detect the presence of algal, archaeal, bacterial, fungal and parasitical species in a test sample {}^{\circ}

```
and parasitical species, genus, family and group. A nucleic acid (I) obtained using the method of the invention can be used for the universal detection of any bacterium, fungus or parasite in a sample and for the detection of at least one antimicrobial agent resistance gene or at least one toxin gene. hexA nucleic acids are used for the specific and ubjuditous detection and for identification of Streptococcus pneumoniae. (I) can be used to design a therapeutic agent which is effective against microorganisms. Microbial species or genus or family or phylum or group which can be detected include Abiotrophia adiacens, Bordetella sp., Corynebacterium sp., Enterobacteriaceae group, Escherichia coli, Mycobacteriaceae family, Pseudomonads group, Streptococcus sp., Whosecteriaceae family, Pseudomonads group, Streptococcus sp., Weisseria gonorrhoeae and Staphylococcus sp., Using DNA based tests provides faster results than substrate specificity tests as results can be determined in an hour and improved accuracy is also achieved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAH00010 to AAH002304 represent nucleotide sequences and primers/probes which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         962 GGCTGCATGTCGGCGGAGCCCATCACGTCGTCGACGCTGACCGGAAGAAGACGTCGTGGCCA 1021

The present sequence is the rpoB gene from Mycobacterium tuberculosis. Rifamphin resistance is largely associated with point mutations localised in a small core region of 81 base pairs in the rpoB gene, which encodes the RNA polymerase beta subunit. To detect a mutation, a complex is formed comprising a first sequence representing the predetermined region of the gene of the organism and a second sequence representing the corresponding region of the gene of the wild type organism in double stranded form. Each member of at least one pair of non-complementary stranded form. Each persence of the mutation of the labels in the complex has a label. The association of the labels in the complex is related to the presence of the mutation. The presence of the mutation is related to the drug resistance of the strain.
Example 1; Fig 4; 86pp; English.
\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\circ}\overset{\circ}{\ci
